Project: part 2 documentation

October 7, 2019

Overview

The purpose of this website is to provide a database that shows which orders has been placed for the Zimino Italian cuisine restaurant. This application provides a website with a main webpage, a connect webpage and a menu webpage. In addition to a webpage for the customer to place an order. Another website for the customer to change the customer's order. A website for the customer to cancel his or her order and another website that shows all the orders by the customers.

Table of Contents

Part 1: Project description

1. MySQL Tables
2. Entity-relationship (ER) diagram
3. Normalization

Part 2: How to use the program

1. System requirements
2. Running this project
3. Description of the web pages with screenshots

Part 3: Team

Part 4. Source code on Github

Part 5: Reference

Part 1: Project description

1. The MySQL Tables for this project:

customer table:

customer_id	Int unsigned not null_auto increment primary key
first	Tinytext - first name
last	Tinytext - last name
ordered_id	FOREIGN KEY(ordered_id) REFERENCES ordered (ordered_id)

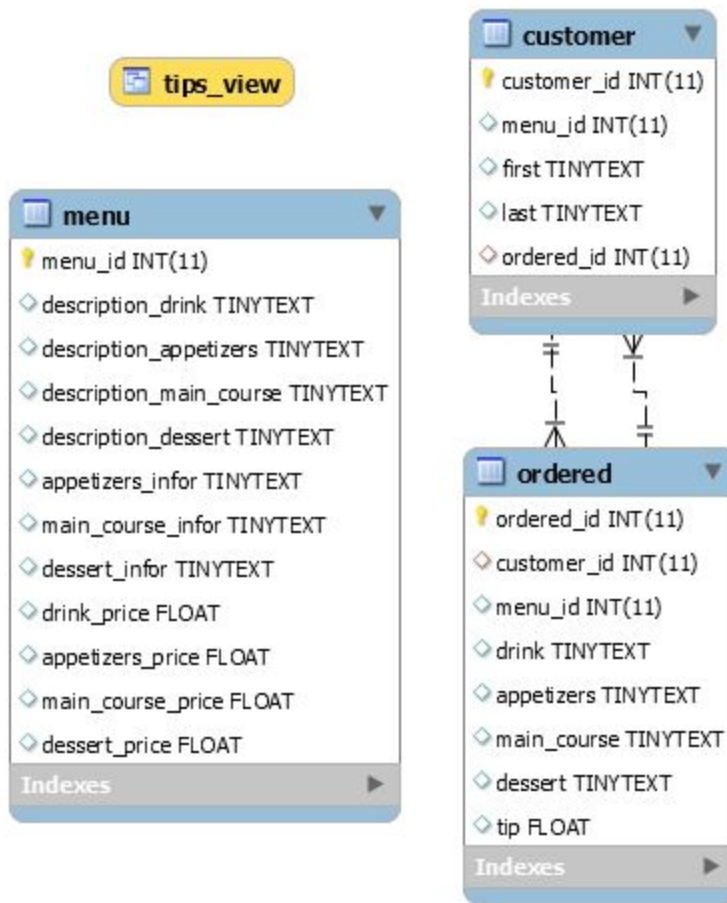

menu table:

menu_id	Int unsigned not null_auto increment primary key
description_drink	Tiny text - drinks from the menu
description_appetizers	Tiny text - appetizers from the menu
description_main_course	Tiny text –main courses from the menu
description_dessert	Tiny text – desserts from the menu
appetizers_infor	Tiny text - appetizers information from the menu
main_course_infor	Tiny text –main courses information from the menu
drink_price	Float drink price
appetizers_price	Float appetizers price
main_course_price	Float main course price

ordered Table:

ordered_id	Int unsigned not null_auto increment primary key
customer_id	Int unsigned not null_auto increment foreign key FOREIGN KEY(customer_id) REFERENCES Customer (customer_id) (If the value of the customer_id is zero, then the order has not been placed. If the value of the customer_id is greater than zero, then the order is placed.)
drink	tinytext
appetizers	tinytext
main_course	tinytext
dessert	tinytext
tip	float (use View)

2. Entity-relationship (ER) diagram:

3. Normalization

- This is a normalized design. There are three tables in the Zimino schema. The customer table is used to store the customer's first and last name. The menu table is used to store the Zimino restaurant's menu items. The ordered table is used to store the customer's orders. The tables are limited to a different purpose to reduce the redundancy of the data in the Zimino database.

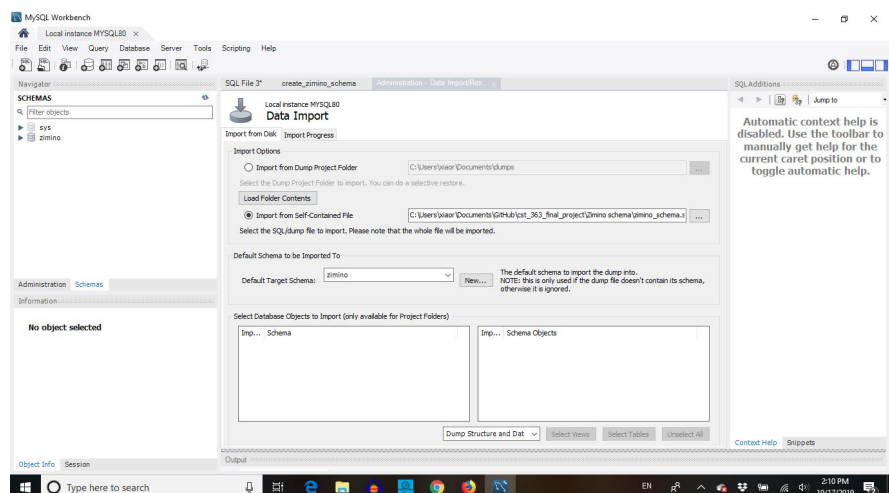

Part 2: How to use the program

1. System requirements:

- a. Software
 - i. Eclipse enterprise version
 - ii. Apache Tomcat 8.5 or Apache Tomcat 9.0
 - iii. MySQL Workbench 8.0
 - iv. MySQL JDBC driver
 - v. Windows 10
 - vi. Java JRE Server 8

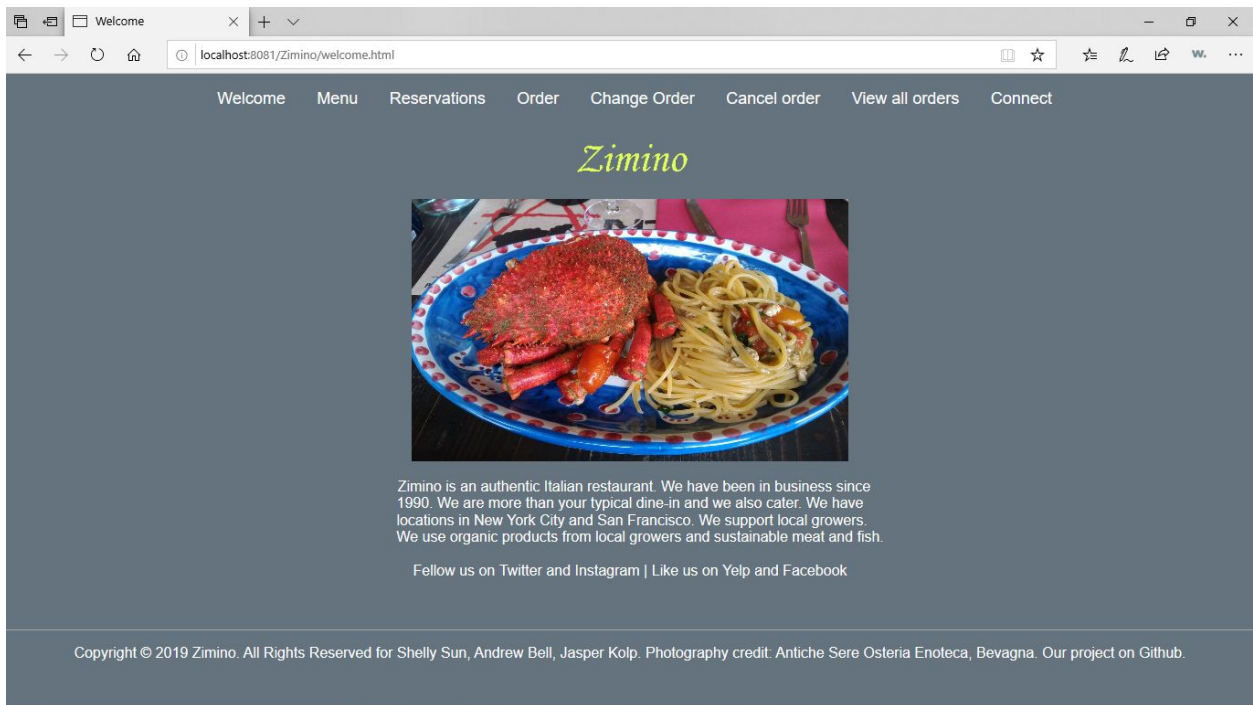

2. Running this project:

- a. In MySQL workbench from the Zimino schema folder:
 - i. Run create_zimino_schema.sql to initialize the zimino schema.
 - ii. Import the zimino tables:
 1. Click on Server, from the drop down list, select Data Import then select Import from Self-Contained File, and import the zimino_schema.sql into the zimino database. Click on the Import Progress tab and the Start Import button to import the zimino_schema.sql file into the Zimino database. This initializes the tables, populates the tables with data and creates a view in the ordered table.

- b. In Eclipse enterprise version:
 - i. Import the Zimino folder to initialize the Zimino website project.
 1. Change the passwords in Cancel.java, Order.java, Ordered.java, Select_cancel.java, updatedOrder.java, order.jsp, and updateOrder.jsp.
 2. Run the welcome.html webpage to initialize the Zimino database website.

3. Description of the websites with screenshots:

Welcome webpage: This is the main page of the Zimino restaurant database website.

Menu webpage: This is the menu of the Zimino restaurant database website.
